Chemical Analysis Report — Collar Residue recipient: Mentalist  
(host evidence folder) revealed\_in: Round 3 quantity: 1 stock:  
8.5x11 white, plain (NOT hotel letterhead) — fax-quality lab paper  
feel finish: Single-sided. Tech initials in blue ballpoint AFTER  
print, small “RUSH” stamp in red ink top-right (optional).**

# Chemical Analysis Report — Print Spec

**Use:** Round 3 reveal. Lab confirms the “coffee” stain on Paloma’s dress-shirt collar was a plant-derived dermal toxin with a deep brown color signature, commonly disguised in coffee or cocoa preparations. This is the visual hinge for the R3 climax — the brown on the collar matches the brown in Irina’s “Café Cubano” tin, Gloria’s brown-Sharpie “insulin pen,” the smear on Gloria’s handkerchief, and Gloria’s cuff stain.

## Layout notes

- **Distinctly NOT hotel letterhead.** This is a Cayman government forensic lab document. Plain header, monospaced body where possible, dense form fields up top, narrative result block below.
  - Header reads as official: lab name, address, case-file watermark feel.
  - Use a fixed-width / typewriter font for the chain-of-custody and instrument lines — sells the “exported from a lab system” look.
  - **MANUAL POST-PRINT:** tech signature line in blue ballpoint. Optional red “RUSH — POLICE LIAISON” stamp top-right corner. A faint brown coffee-ring smudge on the lower margin sells it but is optional.
  - Single page. Forensic terseness. No chemistry lecture.
-

### CHEMICAL ANALYSIS REPORT

**Case File:** CIGL-TOX-2026-0488 **Date Received:** [event date] **Date Reported:** [event date]  
**Submitting Agency:** RCIPS — Major Incident Unit (Liaison: D/Sgt. A. Bodden) **Priority:**  
RUSH — Death Investigation

#### CHAIN OF CUSTODY

| EXHIBIT ID | DESCRIPTION                                                                                             | RECEIVED FROM |
|------------|---------------------------------------------------------------------------------------------------------|---------------|
| CIGL-488-A | White dress shirt, men's, size 16.<br>Collar interior – visible brown<br>residue, ~3cm irregular stain. | RCIPS Evid.   |
| CIGL-488-B | Cotton fiber lift, collar interior<br>(control sample, adjacent area).                                  | RCIPS Evid.   |

**Instrumentation:** GC-MS (Agilent 7890B / 5977A) · LC-MS confirmation run. **Method Ref:**  
CIGL-TOX-SOP-14 (alkaloid screen, dermal absorption profile).

#### FINDINGS — Exhibit CIGL-488-A (collar residue):

Sample is a plant-derived alkaloid compound, slow-acting on dermal contact. Identification consistent with a cardio-active glycoside in a refined particulate carrier. The compound is **deep brown** in its concentrated form and is routinely cut with, or disguised within, **roasted coffee or cocoa preparations** — the color and aroma of either readily mask the agent at typical dosing.

Onset via skin contact: gradual, 1–3 hours. Symptoms: progressive weakness, blurred vision, cardiac irregularity. Dermal exposure of the magnitude observed on Exhibit A is consistent with significant systemic absorption over an evening's wear, but is **not, in isolation, acutely lethal** within that window.

#### FINDINGS — Exhibit CIGL-488-B (control fiber):

Negative for the target compound. Residue is localized to the inner collar.

#### NOTES:

1. Color signature of the collar residue (deep brown, fine particulate) is **consistent with a separately submitted reference sample** recovered from a tin labeled “Café Cubano — Especial” (RCIPS Exhibit CIGL-489). The two samples are chemically and visually indistinguishable on this run.
2. Recommend cross-comparison with any further brown-staining exhibits recovered at scene (clothing, handkerchiefs, injection devices). All such material should be considered the same agent until ruled out.
3. Death-causation determination is **outside the scope of this report**. Refer to ME’s office.
