
**job_id: HLE-06 category: Hotel Letterhead Evidence title:
Preliminary Autopsy Finding — Rathbone, P. recipient: Mentalist
(host evidence folder) revealed_in: Round 3 quantity: 1 stock:
8.5x11 white, plain (NOT hotel letterhead) — government office
bond finish: Single-sided. ME signature in blue ballpoint AFTER
print. Optional “PRELIMINARY — NOT FOR RELEASE” stamp
top-right in red.**

Preliminary Autopsy Finding — Print Spec

Use: Round 3 reveal, immediately AFTER the chemical analysis (HLE-05). Establishes the second vector: the puncture wound on the LEFT side of the neck, paralytic agent on board, and — critically — the same deep-brown color signature as the shirt residue and the contents of the recovered “insulin pen.” This locks the chain to Gloria.

Layout notes

- **NOT hotel letterhead.** Cayman Islands Coroner / ME’s office header. Plain, official, terse.
 - Single page. Form-style top block (decedent, case #, examiner), narrative findings, terse conclusion line, signature block.
 - Use a serif body font for the narrative; the form-fields up top can be lighter/typewriter to differentiate.
 - **MANUAL POST-PRINT:** ME signature in blue ballpoint on the signature line. Optional red rubber-stamp “PRELIMINARY — NOT FOR RELEASE” top-right corner.
 - Forensic terseness. The two load-bearing phrases — “left side of neck” and “same color signature as the shirt residue and the contents of the recovered insulin pen” — must read clean from across a table.
-

PRELIMINARY POST-MORTEM EXAMINATION

Case No.: CME-2026-0312 **Decedent:** RATHBONE, Paloma Elise — Female, 41 yrs
Found: Heathens Hollow Hotel, service corridor (Floor B/G) **Date of Examination:** [event date] **Examiner:** Dr. L. Conolly, M.D., Forensic Pathologist **Status:** PRELIMINARY — pending toxicology confirmation

EXTERNAL EXAMINATION

Well-nourished female. No defensive injuries to hands or forearms. Clothing as recovered: white linen dress shirt (submitted as RCIPS exhibit; see CIGL-TOX-2026-0488). Visible deep-brown residue on inner collar, noted at intake.

Single puncture wound, left side of neck, lateral aspect, approx. 4 cm inferior to the angle of the mandible, overlying the sternocleidomastoid. Wound is small-bore, clean-margin-ed, consistent with a **small-gauge hypodermic injection** (≤ 27 gauge). Minimal surrounding bruising; consistent with antemortem injection delivered shortly before circulatory arrest. No other puncture sites identified.

INTERNAL EXAMINATION (summary)

No significant pre-existing pathology. Findings consistent with rapid neuromuscular failure superimposed on prior systemic compromise. Petechiae and pulmonary congestion noted.

TOXICOLOGY (preliminary, on-site rapid screen)

Femoral blood positive for a plant-derived **paralytic agent**. The agent presents the **same deep-brown color signature as the shirt collar residue (CIGL-488-A) and as the contents of the recovered “insulin pen” device submitted alongside the body** (RCIPS Exhibit CIGL-491). All three are visually and, on rapid screen, chemically consistent. Confirmatory GC-MS pending — see CIGL-TOX file.

TIME OF DEATH

Estimated window: **22:20 – 22:30** (event date), based on liver temperature at scene, lividity progression, and witnessed-event reconciliation.

PRELIMINARY CAUSE OF DEATH

Acute respiratory and cardiac failure secondary to injected paralytic, on a background of dermal toxin exposure. **Manner: HOMICIDE.**

Examiner: Dr. L. Conolly, M.D. **Signature:** _____ (*blue ballpoint, after print*) **Date:** [event date]

Preliminary — subject to amendment upon receipt of confirmatory toxicology. Page 1 of 1.
